BATTERY POWERED SMS TEXT ALARM DIALLER

Alarm System

Do you have items of value stored in a remote location?

End2End Software has designed an indoor alarm system specifically for use in situations where there is no access to mains power, or telephone lines.

Simple to use

The main unit, once programmed and installed, will communicate with you via your mobile phone (s). It operates on all UK GSM networks.

Measures 100mm x 100mm

Two way text messaging

The system notifies you when the alarm is triggered and keeps you informed by text messaging up to 10 mobile phones.

The unit obeys text message instructions from you.

No external power required for operation

Our alarm uses a small, rechargeable internal battery, which can last for up to a year before needing a recharge. An optional solar panel is available, which would keep the battery 'topped up', thus eliminating the need for re-charging.

Useful security features

Included in the basic package is a special key entry system. An electronically coded key enables/disables the alarm whilst you are at the premises.

Optional security items include:

- An audible alarm 'sounder'
- Up to 4 indoor motion sensors (1 Motion or Door sensor included in basic system)
- A door movement/tampering sensor
- A 'listen-in' microphone

These security features are connected to the main unit, so if they were activated, you would be alerted by text message.

As far as our research shows, there is no other system on the market that can provide such a compact security solution with as long a battery life.
